Brochure éditée en application du décret n° 2002-1508 du 23 décembre 2002, relatif à l'information sur la consommation de carburant et les émissions de dioxyde de carbone des voitures particulières neuves.

L'ÉTIQUETAGE ÉNERGIE/CO₂ DES VÉHICULES PARTICULIERS NEUFS

En application de l'arrêté du 10 novembre 2005, une étiquette CO₂ est apposée depuis le 10 mai 2006, sur tout véhicule particulier neuf, exposé dans les lieux de vente en France. L'objectif de la mise en place de cette nouvelle étiquette est de proposer des améliorations à la directive européenne 1999/94, relative à l'information sur la consommation de carburant et les émissions de CO₂ des voitures particulières neuves. L'étiquette comporte sept classes de couleurs différentes (comme pour les appareils ménagers). Elle permet à tout acheteur potentiel d'une automobile d'être renseigné de manière lisible et comparative sur ses émissions de dioxyde de carbone (CO₂), principal gaz à effet de serre responsable du changement climatique. Figurent également sur l'étiquette les consommations de carburant. Rappelons que moins on consomme de carburant, moins on émet de dioxyde de carbone (CO₂) et moins on contribue au changement climatique.

LE BONUS ÉCOLOGIQUE GRENELLE DE L'ENVIRONNEMENT

Première mesure découlant du Grenelle de l'Environnement, ce dispositif, objet des décrets n° 2007-1824 du 25 décembre 2007, n° 2007-1873 du 26 décembre 2007, n° 2009-66 du 19 janvier 2009 et du décret n° 2009-1581 du 19 décembre 2009, a pour objet d'inciter financièrement les acheteurs de véhicules neufs à privilégier les voitures les moins émettrices de CO₂. Il est fondé sur un barème, fonction du nombre de grammes de CO₂ émis par kilomètre pour les voitures neuves, il est composé de :

Un bonus à l'achat pour les véhicules neufs émettant, au plus, 125 g de CO₂/km.

Plus les émissions de CO₂ sont faibles, plus le bonus est élevé :

Taux de CO ₂ /km	Montant de l'aide en 2010
moins de 60 gCO ₂ /km	5 000 € *
entre 61 et 95 gCO ₂ /km	1 000 €
entre 96 et 115 gCO ₂ /km	500 €
entre 116 et 125 gCO ₂ /km	100 €
entre 126 et 155 gCO ₂ /km	0 €

* l'aide accordée ne peut pas excéder 20 % du coût d'acquisition toute taxe comprise du véhicule augmenté, s'il y a lieu, du coût de la batterie si celle-ci est prise en location.

Un super bonus dit « prime à la casse » pour inciter à se débarrasser des voitures les plus polluantes.

Depuis le 4 décembre 2008, un dispositif de soutien au remplacement des véhicules anciens est mis en place : le bonus est majoré d'un superbonus ou prime à la casse lorsque l'acquisition ou prise en location du véhicule neuf s'accompagne du retrait de la circulation d'un véhicule particulier ou d'une camionnette de plus de dix ans. Cette « prime à la casse » est cumulable avec le bonus.

Date de la commande ou de la signature du contrat de location	Date de la facturation	Émission de CO ₂ de la voiture neuve en g/km	Montant de la prime à la casse
Avant le 31/12/2009	Du 31/12/2009 au 31/03/2010	< 161	1 000 €
	Du 01/04/2010 au 30/09/2010		700 €
	Du 01/10/2010 au 31/03/2011		500 €
Du 01/01/2010 au 30/06/2010	Du 01/01/2010 au 30/09/2010	< 156	700 €
	Du 01/10/2010 au 31/03/2011		500 €
Du 01/07/2010 au 31/12/2010	Du 01/07/2010 au 31/03/2011	< 156	500 €

Un malus à l'achat pour les véhicules neufs émettant plus de 155 g de CO₂/km est également institué. Le montant du malus progresse en fonction de l'augmentation des émissions de CO₂ par kilomètre :

Taux de CO ₂ /km	Montant du malus en 2010
entre 156 et 160 gCO ₂ /km	200 €
entre 161 et 195 gCO ₂ /km	750 €
entre 196 et 245 gCO ₂ /km	1 600 €
+ de 246 gCO ₂ /km	2 600 €

Généralement, c'est le concessionnaire qui procède à l'immatriculation du véhicule en préfecture. C'est donc lui qui facture le malus en l'incluant dans la facture sur le poste des « frais d'immatriculation ».

Si un particulier procède lui-même à l'immatriculation de son véhicule en préfecture, il paie le malus en même temps que sa carte grise.

Un malus annuel. La loi de finances 2009 a instauré un malus annuel. Il est de 160 € pour les véhicules particuliers achetés en 2010 et émettant plus de 245 g/km de CO₂.

Pour ces véhicules, ayant fait l'objet d'une réception communautaire et immatriculés pour la première fois en France à compter du 1^{er} janvier 2010, le malus annuel sera à régler à compter de 2011.

La taxe est due par les propriétaires et les locataires. Les sociétés soumises à la Taxe sur les Véhicules de Société sont exonérées de ce malus annuel.

Les redevables seront informés du malus à payer par l'administration qui leur adressera un titre de perception.

Mesures complémentaires relatives au Bonus/Malus

- Véhicules pour famille nombreuse.

Depuis le 1^{er} janvier 2009, un abattement de 20 grammes de CO₂ par enfant à charge, à compter du troisième enfant, est appliqué sur les niveaux d'émissions soumis au malus. Cette réduction est limitée à un seul véhicule

de cinq places et plus par foyer de trois enfants et plus.

- Véhicules fonctionnant au superéthanol E85.

Depuis le 1^{er} janvier 2009, les véhicules fonctionnant au superéthanol E85 bénéficient d'un abattement de 40 % sur les niveaux d'émissions de dioxyde de carbone mesurés lors de leur homologation.

Toutefois, cet abattement ne s'applique pas aux véhicules dont les émissions de dioxyde de carbone sont supérieures à 250 g/km et ne permet pas d'obtenir un bonus.

- Véhicules acquis par des personnes à mobilité réduite.

Les véhicules dont la carte grise porte la mention « handicap », ou ceux acquis par un titulaire d'une carte d'invalidité ou par une personne en charge d'un titulaire de cette carte ne sont pas concernés par le malus.

- Le malus à l'achat se cumule avec la taxe sur les véhicules de société. Ce malus est payé au moment de la première immatriculation, alors que la taxe sur les véhicules de société doit être versée tous les ans.
- Un particulier ayant acheté une voiture dans un autre pays de la communauté européenne n'ayant pas fait l'objet précédemment d'une première immatriculation paiera le malus en préfecture au moment de la demande d'immatriculation en France. S'il peut bénéficier d'un bonus, il devra faire la demande auprès de

l'ASP (agence des services et des paiements) (www.asp-public.fr) dans les trois mois suivant l'acquisition.

Pour les véhicules introduits en France après avoir été immatriculés dans un autre pays, aucun bonus ne pourra être obtenu et le malus éventuel sera réduit d'un dixième par année écoulée depuis cette première immatriculation.

- Dans le cas d'un véhicule n'ayant pas fait l'objet d'une réception communautaire, un bonus de 200 € sera accordé si la puissance administrative de celui-ci n'excède pas quatre chevaux-vapeur. Un malus sera appliqué en fonction de la puissance administrative du véhicule selon le barème suivant :

PUISSANCE FISCALE (en chevaux-vapeur)	Montant de la taxe (en euros)
Puissance fiscale ≤ 7	0
$8 \leq$ puissance fiscale ≤ 11	750
$12 \leq$ puissance fiscale ≤ 16	1 600
$16 <$ puissance fiscale	2 600

- Pour les particuliers achetant des véhicules fonctionnant exclusivement ou non au moyen de gaz de pétrole liquéfié ou de gaz naturel véhicules ou combinant l'énergie électrique et une motorisation à l'essence ou au gazole, et n'émettant pas plus de 135 g de CO₂/km, le bonus sera de 2 000 €. Pour les acheteurs autres que les particuliers, c'est le barème général qui s'applique :
 - 5 000 € pour les véhicules émettant au plus 60 g de CO₂ /km. Attention : l'aide accordée ne peut pas excéder 20 % du coût d'acquisition

toute taxe comprise du véhicule augmenté, s'il y a lieu, du coût de la batterie si celle-ci est prise en location.

- 1000 € pour les véhicules dont les émissions sont comprises entre 61 g et 95 g de CO₂.
 - 500 € pour les véhicules dont les émissions sont comprises entre 96 et 115 g de CO₂.
 - 100 € quand les émissions de CO₂ sont comprises entre 116 et 125 g de CO₂/km.
- Les particuliers ayant fait effectuer des travaux de transformation par des professionnels habilités, destinés à permettre le fonctionnement au moyen du gaz de pétrole liquéfié d'un véhicule essence bénéficient d'un bonus de 2 000 € :
 - si le taux d'émission de dioxyde de carbone par kilomètre parcouru du véhicule avant transformation n'excède pas 155 g de CO₂/km ;
 - si les travaux de transformation sont effectués dans un délai de 3 ans à compter de la date de sa première mise en circulation.

LES TAXATIONS RELATIVES AUX ÉMISSIONS DE CO₂

Pour réduire les émissions de gaz à effet de serre, la consommation nationale et la dépendance énergétique de la France, deux taxes ont été mises en œuvre : la taxe additionnelle sur les cartes grises et la taxe annuelle sur les véhicules de société.

La taxe additionnelle sur la carte grise pour les véhicules d'occasion mis en circulation après le 1^{er} juin 2004

Le barème de la taxe additionnelle sur la carte grise est fonction du niveau d'émission de dioxyde de carbone (CO₂) du véhicule. Le montant de celle-ci s'ajoute au prix de base de la carte grise. Elle s'applique lors de toutes les immatriculations ou transactions portant sur les véhicules d'occasion dont la première mise en circulation est postérieure au 1^{er} juin 2004 (les émissions de CO₂ sont mentionnées sur la carte grise depuis cette date).

Pour les véhicules **ayant fait l'objet d'une réception communautaire**, le calcul de la taxe s'effectue selon les modalités suivantes :

- pas de surtaxe pour les véhicules dont les émissions de CO₂ sont inférieures ou égales à 200 grammes par kilomètre ;

- 2 € par gramme pour les véhicules dont les émissions de CO₂ se situent entre 201 et 250 grammes.

Exemple : pour un véhicule dont l'émission est de 230 grammes de CO₂ par km, soit 30 g de CO₂ émis en plus des 200 g non surtaxés, la taxe additionnelle est de $2 \text{ €} \times 30 = 60 \text{ €}$.

- 4 € par gramme pour les véhicules dont les émissions de CO₂ sont supérieures à 250 grammes.

Exemple : pour un véhicule dont l'émission est de 320 grammes de CO₂ par km, on calcule donc 2 €/g de 201 à 250 g de CO₂/km, soit $2 \text{ €} \times 50 = 100 \text{ €}$
 puis 4 €/g de 251 à 320 g de CO₂/km, soit $4 \text{ €} \times 70 = 280 \text{ €}$,

la taxe additionnelle est de $100 \text{ €} + 280 \text{ €} = 380 \text{ €}$.

- pour les véhicules spécialement équipés pour fonctionner au moyen du superéthanol E85, le montant de la taxe est réduit de 50 %.

Pour les autres véhicules, **n'ayant pas fait l'objet d'une réception communautaire**, le calcul de la taxe additionnelle s'effectue en fonction de la puissance fiscale.

PUISSANCE FISCALE	Tarif
Inférieure à 10 CV	0 €
Supérieure ou égale à 10 CV et inférieure à 15 CV	100 €
Supérieure ou égale à 15 CV	300 €

NB : certains Conseils Régionaux peuvent exonérer partiellement ou totalement du coût de la carte grise les propriétaires de véhicules électriques, hybrides ou fonctionnant au gaz (gaz naturel véhicules ou gaz de pétrole liquéfié) ou au superéthanol E85.

La taxe annuelle sur les véhicules de société (TVS)

Les sociétés sont soumises à une taxe annuelle sur les véhicules qu'elles utilisent en France, lorsque ces véhicules sont immatriculés dans la catégorie des voitures particulières au sens de la directive 70/156/CEE du Conseil, du 6 février 1970.

La loi de finances 2006 a précisé, par ailleurs, que les véhicules possédés ou pris en location par les salariés ou par les dirigeants et pour lesquels la société procède au remboursement des frais kilométriques sont considérés comme des véhicules utilisés par les sociétés. Les véhicules fonctionnant exclusivement ou non au moyen de l'énergie électrique, du gaz naturel véhicules, du gaz de pétrole liquéfié ou du superéthanol E85 sont exonérés de la taxe sur les véhicules de société. Les véhicules fonctionnant alternativement au moyen de supercarburants et de gaz de pétrole liquéfié sont exonérés de la moitié de la taxe. Ces exonérations partielles ou totales s'appliquent pendant une période de huit trimestres, décomptée à partir du premier jour du trimestre en cours à la date de première mise en circulation du véhicule.

Pour les véhicules ayant fait l'objet d'une réception communautaire au sens de la même directive, le montant de cette taxe dépend du niveau d'émission de CO₂ des véhicules.

Pour ces véhicules dont la première mise en circulation est intervenue à compter du 1^{er} juin 2004, et qui n'étaient pas possédés ou utilisés par la société avant le 1^{er} janvier 2006, le tarif applicable est le suivant :

TAUX D'ÉMISSION DE DIOXYDE DE CARBONE (en gramme par kilomètre)	Tarif applicable par gramme de dioxyde de carbone
Inférieur ou égal à 100 g/km	2 €
Supérieur à 100 et inférieur ou égal à 120 g/km	4 €
Supérieur à 120 et inférieur ou égal à 140 g/km	5 €
Supérieur à 140 et inférieur ou égal à 160 g/km	10 €
Supérieur à 160 et inférieur ou égal à 200 g/km	15 €
Supérieur à 200 et inférieur ou égal à 250 g/km	17 €
Supérieur à 250 g/km	19 €

Exemple 1 : pour un véhicule ayant fait l'objet d'une réception communautaire et dont l'émission de CO₂ est de 128 g par km, la TVS est de 640 € (128 x 5 €).

Exemple 2 : pour un véhicule ayant fait l'objet d'une réception communautaire et dont l'émission de CO₂ est de 180 g par km, la TVS est de 2 700 € (180 x 15 €).

Pour les autres véhicules, **n'ayant pas fait l'objet d'une réception communautaire**, le tarif dépend toujours de la puissance fiscale du véhicule. Il est le suivant :

PUISSANCE FISCALE	Tarif applicable
Inférieure ou égale à 4 CV	750 €
De 5 à 7 CV	1 400 €
De 8 à 11 CV	3 000 €
De 12 à 16 CV	3 600 €
Supérieure à 16 CV	4 500 €

Exemple : pour un véhicule n'ayant pas fait l'objet d'une homologation communautaire et dont la puissance fiscale est de 7 CV, la TVS est de 1 400 €.

Depuis le 1^{er} janvier 2006 (article 1010-0 A du Code général des impôts), les véhicules, possédés ou pris en location par les salariés contre

remboursement d'une indemnité kilométrique, sont imposés à la TVS au nom de la société. Le montant de la taxe sur les véhicules de sociétés est fonction d'un coefficient, dépendant du nombre de kilomètres pris en compte pour le remboursement au propriétaire ou à l'utilisateur des frais kilométriques desdits véhicules, durant la période d'imposition.

Taux d'assujettissement à la TVS	Barème
0 %	0 à 15 000 km
25 %	15 001 à 25 000 km
50 %	25 001 à 35 000 km
75 %	35 001 à 45 000 km
100 %	supérieur à 45 000 km

Après application du coefficient pondérateur, un abattement de 15 000 € est appliqué sur le montant total de la TVS due par la société pour l'ensemble des véhicules possédés ou loués par les salariés ou les dirigeants.

Le malus se cumule avec la taxe sur les véhicules de société. Ce malus est payé au moment de la première immatriculation, alors que la taxe sur les véhicules de société doit être versée tous les ans.

L'EFFET DE SERRE

**et la nécessité de
réduire les émissions
de gaz carbonique**

CO₂

La combustion des carburants produit des gaz, le gaz carbonique (CO₂) en particulier. Ce gaz contribue avec d'autres gaz au phénomène de l'effet de serre, c'est-à-dire au réchauffement de la surface de la terre et de l'atmosphère.

Au niveau national, le Grenelle de l'Environnement, initié à l'été 2007, a fixé des objectifs ambitieux pour le secteur des transports.

Globalement, il s'agit de réduire les émissions de gaz à effet de serre de 20 % d'ici 2020, afin de les ramener à cette date au niveau qu'elles avaient en 1990. Il convient également de diminuer la dépendance de ce secteur aux produits pétroliers. Pour les véhicules particuliers, la moyenne des émissions de l'ensemble du parc automobile français en circulation est actuellement de 169 g de CO₂/km. L'objectif fixé est d'atteindre un niveau de 130 g à l'horizon 2020.

À ce titre, le Gouvernement a lancé, en complément du Bonus/Malus, un programme de véhicules décarbonés. Celui-ci soutient la recherche et le développement de véhicules hybrides et électriques, notamment dans le cadre du Fonds démonstrateur géré par l'ADEME.

Au niveau communautaire, le Parlement européen a adopté, le 17 décembre 2008, le compromis sur le projet de loi visant à réduire les émissions de CO₂ des voitures neuves à partir de 2012.

Ce compromis prévoit d'étaler, sur la période 2012-2015, l'effort demandé aux constructeurs pour ramener la moyenne des émissions de CO₂ des voitures neuves à **130 grammes par km** (120 g/km en comptant la contribution des équipements et des pneumatiques). Il convient de rappeler que la moyenne des émissions des véhicules neufs vendus en Europe s'élève à 147 g de CO₂/km en 2009.

Le compromis introduit un second objectif de **95 grammes de CO₂/km d'ici à 2020**.

CONSOMMATIONS DE CARBURANT ET ÉMISSIONS DE CO₂

Les carburants sont des mélanges d'hydrocarbures, dont la composition dépend du produit : essence, gazole, gaz de pétrole liquéfié (GPL), gaz naturel véhicules (GNV) ou superéthanol (E85). Ce dernier est un biocarburant, utilisé dans les véhicules à carburant modulable (VCM) qui peuvent rouler avec des taux d'éthanol variant entre 0 et 85 %. Un carburant, ou une quantité d'hydrocarbures, qui brûle dans un moteur, produira une quantité de gaz carbonique proportionnelle à la masse de carbone que contient le carburant. La quantité de CO₂ dégagée par un moteur est donc proportionnelle à la consommation du carburant qu'il utilise. Dans le cas d'utilisation de biocarburant, on peut défalquer la part carbone d'énergie renouvelable introduite dans le réservoir, liée à l'absorption du CO₂ lors de la croissance des plantes.

COMMENT RÉDUIRE LES ÉMISSIONS DE CO₂ DES VÉHICULES

Bien choisir son véhicule à l'achat

Puisque les véhicules émettent du gaz carbonique proportionnellement à leur consommation, il faut tenir compte, lors de l'acquisition d'un véhicule, de sa consommation spécifique, qui déterminera ses rejets de gaz carbonique.

La performance énergétique

La consommation conventionnelle est une valeur

théorique – *a priori* plus faible que la consommation réelle – établie en fonction d'une procédure de mesures normalisée à l'échelon européen, commune à l'ensemble des modèles présentés dans nos tableaux. Elle permet de comparer les véhicules, les uns par rapport aux autres, en fonction de leurs performances énergétiques.

Au cours des dernières années, l'amélioration du rendement énergétique des moteurs, l'évolution de l'aérodynamique et l'utilisation de matériaux plus légers, ont permis de gagner de 15 à 20 % en consommation. Parallèlement, l'intégration de systèmes de sécurité complexes et d'équipements de confort a alourdi les véhicules.

Pour compenser ces suppléments de poids, des motorisations plus puissantes, donc plus gourmandes en carburant, ont été adoptées. C'est ainsi que le bénéfice des progrès réalisés peut, dans certains cas, être minoré.

La mesure des émissions de CO₂

Pour permettre d'apprécier objectivement la consommation conventionnelle d'un véhicule et les émissions de CO₂, une procédure de mesure au banc à rouleaux, effectuée sur un cycle de roulage, dit « mixte », représentatif de la circulation urbaine et périurbaine, a été définie au niveau européen. Les valeurs de consommations, exprimées en litres aux 100 km, sont mesurées par des laboratoires agréés. En France, c'est l'Union Technique de l'Automobile, du Motocycle et du Cycle (UTAC) qui est chargée de la mise en œuvre de cette procédure.

Les tableaux des consommations et des rejets de CO₂ permettront donc de choisir un véhicule en toute connaissance de ses performances. Les listes des véhicules essence et Diesel les plus performants pourront servir de références (voir chapitre « Palmarès »).

Écart entre consommations réelles et consommations conventionnelles

Dans la réalité, des différences apparaissent entre les valeurs conventionnelles indiquées dans les tableaux et les valeurs réelles de consommation.

Ces écarts sont liés à de nombreux facteurs (style de conduite, entretien du véhicule, conditions de circulation...) augmentant la consommation et le volume de CO₂ et de polluants rejetés.

Bien utiliser son véhicule

Utiliser sa voiture, c'est bien sûr la conduire..., mais c'est aussi l'entretenir, afin de préserver durablement ses qualités d'origine.

Ainsi le capital sécurité sera conservé, les consommations maîtrisées et les nuisances diminuées.

De même, conduire en souplesse, rouler à vitesse modérée, anticiper le freinage, etc. représentent une source d'économies substantielles en termes d'usure et de consommation énergétique du véhicule. Il est donc utile d'être vigilant afin d'optimiser le budget global « automobile » et de valoriser le potentiel de revente de la voiture... Cette démarche aura, parallèlement, des effets positifs dans les domaines de l'énergie et de l'environnement.

À titre d'exemple, les calculs de coûts de surconsommations sont fournis à la fin de ce chapitre.

Bien entretenir son véhicule

Ne pas faire entretenir son moteur par un professionnel de l'automobile, c'est prendre le risque d'affronter, à terme, des pannes coûteuses... et d'entraîner une importante surconsommation de carburant (pouvant aller jusqu'à 25 %, soit environ 2 litres supplémentaires aux 100 km).

On constate également une nette augmentation des émissions d'hydrocarbures imbrûlés (HC), de monoxyde de carbone (CO) et, pour les moteurs Diesel, de particules.

Bien gonfler les pneus

Le gonflage des pneus, toujours réalisé à froid, doit respecter le niveau de pression indiqué par le constructeur, cette information étant inscrite à l'intérieur de la portière avant gauche ou indiquée dans le carnet de bord. Cette pression doit être majorée de 15 % si l'on envisage d'effectuer un parcours autoroutier... Ne pas oublier que des pneumatiques sous-gonflés entraînent une surconsommation d'environ 1 % pour un déficit de seulement 0,3 bar.

Pas de charges inutiles

Rouler avec une galerie (ou des barres de toit) entraîne naturellement une surconsommation. Vide, une galerie oppose une résistance aérodynamique qui augmente la consommation de 10 %.

Chargée, la forme des objets embarqués, ainsi que leur poids, font passer la surconsommation à 15 %. Et, à 120 km/h, ces 15 % coûtent un litre de carburant supplémentaire aux 100 km...

Le départ à froid

Une vitesse trop rapide, réalisée avec un moteur froid, fait croître la consommation de 50 % sur le premier kilomètre et use considérablement le moteur. En outre, cela augmente la quantité de polluants rejetés dans l'atmosphère.

Une solution s'impose : démarrer, rouler immédiatement, en douceur, et ne pas trop solliciter le moteur sur les premiers kilomètres.

Les embouteillages

En termes de consommation d'énergie et de pollution, les embouteillages constituent la situation la plus pénalisante : la consommation d'un véhicule peut quasiment doubler et atteindre près de 16 litres aux 100 km, pour un véhicule de gamme moyenne. Le volume de polluants rejetés atteint alors des seuils préoccupants, particulièrement en zone urbaine. Un accroissement aussi sensible du niveau de pollution constitue un risque réel pour la santé et pour l'environnement. Il convient donc dans la mesure du possible, en particulier en ville, de choisir un autre mode de déplacement.

La climatisation

La climatisation, en voiture, c'est plus de confort et plus de sécurité : la vigilance du conducteur est meilleure quand il a moins chaud et le système fournit un air sec qui désembue très rapidement le pare-brise et les vitres latérales, mais...

On consomme plus et on pollue plus

Quand elle fonctionne, la climatisation augmente notablement la consommation de carburant d'un véhicule. À titre d'exemple, à 25 °C par temps clair, pour un réglage de la climatisation à 20 °C :

- en ville, c'est en moyenne 20 % de carburant consommés en plus ;
- sur route-autoroute, la surconsommation est d'environ 6 %.

Par ailleurs, il est important de noter qu'à confort égal, plus la température extérieure est élevée et plus la surconsommation est importante. De même, plus la température de l'habitacle est réglée en niveau bas et plus la consommation de carburant augmente ; à 30 °C régler sa climatisation à 25 °C au lieu de 20 °C permet de réduire sa consommation

de l'ordre de 8 % en ville et 5 % sur route-autoroute. Sur l'année, en France, l'utilisation de la climatisation entraîne une surconsommation comprise entre 1 et 7 % suivant les climats, les véhicules et les usages. L'impact énergétique de la climatisation limite l'effet des progrès importants réalisés par les constructeurs pour réduire les consommations des véhicules. Dans les prochaines années, l'évolution prévisible du parc automobile laisse envisager une augmentation de la proportion des voitures climatisées, confortant la tendance à l'augmentation des consommations, ce qui va à l'encontre des politiques menées pour limiter les consommations d'énergies fossiles. L'utilisation de la climatisation entraîne aussi une augmentation :

- de la pollution, plus particulièrement en ville (CO, HC et NO_x pour les moteurs à essence, NO_x et particules pour les Diesel) ;
- des émissions de CO₂.

On réchauffe la planète

L'effet de serre est un phénomène naturel, qui maintient sur Terre des températures permettant d'y vivre. Il est dû à la présence, dans l'atmosphère, de certains gaz, dits « à effet de serre », dont les quantités sont augmentées de façon considérable par les activités humaines, ce qui l'accroît et perturbe très gravement le climat de la planète.

La climatisation intervient à double titre dans les émissions de gaz à effet de serre :

- quand elle fonctionne, elle provoque une surconsommation de carburant et donc des émissions de CO₂ accrues (1 à 7 % de CO₂ émis en plus par an) ;
- qu'elle fonctionne ou pas, elle rejette une partie du fluide frigorigène (R134a) présent dans le circuit de climatisation (fuites, opérations de maintenance, entretien, accident, non-récupération en fin de vie du véhicule...). Ce fluide est un

gaz à fort potentiel d'effet de serre, 1 430 fois plus puissant que le CO₂.

Pour un véhicule de gamme moyenne, la climatisation, à elle seule (usage, fuites, fin de vie...), est responsable d'une augmentation de 7 à 13 %, voire plus, de ses émissions annuelles de gaz à effet de serre.

Conseils d'entretien

Faites changer les filtres à air habitacle, et le cas échéant à pollen, tous les ans, mais méfiez-vous des interventions intempestives de certains professionnels. Tant que votre climatisation fait du froid, inutile de la faire réviser, ni de la faire recharger en fluide frigorigène. En cas de fuite importante de fluide frigorigène, la climatisation ne produira plus assez de froid, un contrôle du système est alors nécessaire, pour notamment repérer la fuite et la réparer, avant de le recharger en fluide frigorigène. Souciez-vous du devenir de votre système de climatisation automobile en fin de vie : les fluides frigorigènes doivent être récupérés et non pas s'échapper dans l'atmosphère, ce sont des gaz à fort impact sur l'effet de serre !

Conseils d'utilisation

- Stationnez à l'ombre quand c'est possible.
- Ouvrez les fenêtres pour évacuer la chaleur dans l'habitacle avant d'enclencher la climatisation, mais roulez fenêtres fermées quand elle fonctionne !
- Limitez la température de consigne à 4 ou 5 °C de moins que la température extérieure.
- N'orientez pas les diffuseurs d'air sur votre visage, vous éviterez les maux de gorge !
- Éteignez votre climatisation automatique tant qu'il ne fait pas trop chaud, sinon elle fonctionnera en continu dès que la température intérieure dépassera la consigne.

- Utilisez par temps très chaud la commande « recyclage » pour récupérer l'air frais de l'habitacle et réduire ainsi l'énergie consommée par le système.
- Faites fonctionner régulièrement la climatisation (10 mn par semaine, de préférence lorsque la circulation est fluide), même en hiver, pour limiter les fuites de réfrigérant.

ÉCO-CONDUITE

La conduite agressive

Rouler trop vite, accélérer plus que nécessaire, puis freiner brutalement, changer de rapport de vitesses sans cesse... ce comportement va accroître la consommation de 20 % sur route... et de 40 % en ville ! En zone urbaine, ce sont, en moyenne, 3,5 litres de carburant qui seront consommés en plus aux 100 km, augmentant les émissions de gaz à effet de serre et de polluants.

La conduite mal adaptée

Lors d'une accélération trop longue sans passer la vitesse supérieure, le moteur va tourner trop vite... et donc consommer plus. Il existe, pour chaque rapport de boîte, un régime moteur maximum. Ce régime, exprimé en tours/minute, est souvent inscrit sur le compteur de vitesse de la voiture ou précisé dans son carnet de bord. Pousser constamment le moteur à cette limite, c'est augmenter la consommation du véhicule d'environ 30 % (ce qui représente 2,5 litres de carburant aux 100 km)... ainsi que le volume de CO₂ et de polluants rejetés !

L'ENJEU DE L'AIR

La pollution atmosphérique constitue l'une des préoccupations majeures de ce début de siècle. Elle n'a cependant pas les mêmes effets sur l'homme et l'environnement, selon qu'elle est locale, régionale ou mondiale.

- La pollution régionale est due à la dispersion des polluants à plusieurs centaines de kilomètres des sources d'émission. Leur action dépend des conditions météorologiques (pluies, vents, ensoleillement).
- La pollution mondiale, globale, est à l'origine de problèmes planétaires, tels que la destruction de la couche d'ozone à haute altitude ou l'accroissement de l'effet de serre, susceptible d'occasionner un réchauffement de la Terre accompagné d'effets climatiques indésirables.
- L'échelle locale caractérise les problèmes de pollution que l'on rencontre au voisinage des sources de rejets : sites industriels, axes de circulations... Les sources sont à l'origine de nuisances olfactives, voire de pollutions primaires présentant des risques pour la santé humaine. Parmi ces polluants primaires, on peut citer : le monoxyde de carbone, les hydrocarbures imbrûlés, les oxydes d'azote, les particules en suspension, le dioxyde de soufre...

La pollution automobile

En France, bien que les émissions polluantes régressent dans les différents secteurs d'activité, la part de la pollution liée aux transports est en hausse constante.

La situation est particulièrement préoccupante en zone urbaine, où les transports motorisés

représentent la deuxième source d'émissions d'oxydes d'azote (NO_x) et de particules.

Ils sont également à l'origine d'une part prépondérante des émissions de monoxyde de carbone (CO) et d'hydrocarbures imbrûlés (HC).

Normes européennes d'émissions des voitures particulières

Les tableaux suivants présentent les polluants réglementés par l'Union européenne. Depuis le 1^{er} septembre 2009, c'est la norme Euro 5 qui est en vigueur. Tous les 4 à 5 ans, les seuils d'émissions sont révisés à la baisse.

VÉHICULES ESSENCE

	Norme Euro 4 (en application depuis 2005)	Norme Euro 5 (en application depuis le 1/9/2009)
Émissions maximum en g/km		
Monoxyde de carbone (CO)	1,00	1,000
Hydrocarbures (HC)	0,10	0,100
Oxydes d'azote (NO _x)	0,08	0,060
HC + NO _x	—	—
Particules	—	0,005*
Hydrocarbures non méthaniques (HCNM)	—	0,068

* moteur à injection directe d'essence mélange pauvre seulement.

VÉHICULES DIESEL

	Norme Euro 4 (en application depuis 2005)	Norme Euro 5 (en application depuis le 1/9/2009)
Émissions maximum en g/km		
Monoxyde de carbone (CO)	0,50	0,500
Hydrocarbures (HC)	—	—
Oxydes d'azote (NO _x)	0,25	0,180
HC + NO _x	0,30	0,230
Particules	0,025	0,005
Hydrocarbures non méthaniques (HCNM)	—	—

Les progrès

L'évolution de la réglementation ainsi que les progrès réalisés par les constructeurs automobiles, les équipementiers et les pétroliers, ont permis de minimiser certaines nuisances. Voici quelques-unes des avancées techniques les plus récentes :

Gazole à basse teneur en soufre : la diminution de la teneur en soufre dans le carburant suit l'évolution de la réglementation européenne. L'amélioration de ce carburant a trois avantages : elle engendre une diminution des émissions des SO_2 rejetés dans l'atmosphère, contribue à la réduction de la masse de particules émises et permet le maintien des performances des catalyseurs.

Pot catalytique : le catalyseur est un corps chimique actif à base de métaux précieux, destiné à transformer les rejets polluants en composés non toxiques. Il a été conçu à l'origine pour traiter simultanément l'oxyde de carbone (CO), les hydrocarbures imbrûlés (HC) et les oxydes d'azote (NO_x) émis par les véhicules essence. Une version spécifique équipe, depuis 1997, les véhicules Diesel. Elle n'agit que sur le CO et les HC .

Filtre à particules : réservé aux motorisations Diesel, ce filtre supprime quasi-totalement les rejets de composés polluants solides (fumées noires). Les constructeurs ont commencé à équiper les véhicules Diesel et l'utilisation de ces filtres va se généraliser avec l'entrée en vigueur de la norme Euro 5, le 1^{er} septembre 2009.

Contrôle technique

Des évolutions du contrôle technique sont entrées en vigueur au 1^{er} janvier 2008. Elles visent à améliorer la sécurité des véhicules vérifiés, afin de prévenir les accidents de la route liés à un défaut d'entretien. Ces évolutions devraient entraîner un allongement du temps de contrôle de quelques minutes.

1. Les points de contrôle et contre-visites en vigueur depuis le 1^{er} janvier 2008

Ces nouvelles réglementations résultent de l'arrêté du 13 octobre 2006, publié au journal officiel du 29 décembre 2006. Elles concernent :

- Deux points de contrôle nouveaux découlant des avancées technologiques sur les véhicules les plus récents : contrôle des informations fournies par le système de diagnostic embarqué – OBD, On Board Diagnostics – et contrôle du cache des airbags. En outre, la détérioration de la pédale de frein (absence de caoutchouc) et une anomalie du feu de croisement (phares au xénon) liée au système de nettoyage font désormais l'objet d'un contrôle.
- Deux altérations déjà contrôlées qui donnent dorénavant lieu à contre-visite : défaut d'étanchéité de l'amortisseur et niveau insuffisant du liquide de frein dans son réservoir.

2. La simplification de la nomenclature des points de contrôle

Les points de contrôle sont passés de 125 en 2007 à 116 en 2008. Les altérations sont passées de 511 à 398. Ce regroupement traduit un souci de simplification du contrôle pour n'en garder que les points essentiels et rendre plus rigoureux le contrôle sur les points susceptibles de contre-visites.

COÛTS MOYENS DES VÉHICULES

Chaque usager éprouve des difficultés à calculer de manière précise les coûts liés à l'utilisation de son véhicule. Les transports représentent le troisième poste de dépense des ménages, après le logement et sont proches du poste alimentation. Pour permettre le choix économique d'un véhicule, il faut connaître précisément les postes de dépense liés à son usage. Les tableaux ci-dessous présentent, à titre indicatif, les coûts moyens des véhicules pour 15 000 km par an et les coûts moyens au kilomètre. Ils sont établis suivant la puissance fiscale, la catégorie du véhicule et le carburant utilisé. Ils ont été calculés en intégrant les différents postes de dépenses suivants :

- Valeur résiduelle/dépréciation
- Entretien/maintenance
- Pneumatique
- Carburant
- Assurance
- Frais administratifs/taxes (carte grise, bonus/malus...)
- Intérêt financier (taux fixe de 4,25 %)

Puissance fiscale en CV	Coût annuel moyen pour 15000 km	Coût moyen par km
4	5 100 €	0,34 €
5	6 200 €	0,41 €
6	7 600 €	0,51 €
7	8 600 €	0,58 €
8	10 000 €	0,67 €
9	10 800 €	0,72 €
10	12 700 €	0,85 €
11	13 500 €	0,90 €
12	14 500 €	0,97 €
>12	27 100 €	1,81 €
Moyenne des véhicules	11 500 €	0,77 €

(source JATO pour un kilométrage annuel de 15000 km et une durée de détention de 5 ans)

LES POUR 15 000 KM PAR AN

Catégorie	Moyenne du coût par kilomètre des véhicules	
	Essence	Diesel
 Citadine		
Exemple : Citroën C3, Ford Fiesta	0,41 €	0,37 €
 Compact		
Exemple : Peugeot 308, Renault Mégane	0,63 €	0,53 €
 Familiale		
Exemple : Citroën C5, Peugeot 407, Renault Laguna	0,85 €	0,71 €

PALMARÈS

En application de la directive européenne n° 1999/94/CE du 13 décembre 1999 et du décret n° 2002-1508 du 23 décembre 2002 (voir chapitre « Choisir »), le présent guide doit faire figurer la liste des modèles de voitures particulières neuves les plus performantes en termes de rendement énergétique, classés par ordre progressif d'émissions de CO₂ pour chaque type de carburant (essence et gazole).

L'ADEME a donc établi, pour les dix premières valeurs d'émissions de CO₂, un palmarès figurant en pages suivantes.

Deux classements sont présentés :

- le premier pour les modèles essence,
- le second pour les véhicules Diesel.

Ce palmarès a été élaboré sur la base des données fournies par l'UTAC en décembre 2009.

(Voir « Comment lire les tableaux » page 40.)

CHOISIR

Afin de favoriser la réduction des émissions de CO₂, le Parlement européen et le Conseil de l'Union européenne ont arrêté la directive n°1999/94/CE du 13 décembre 1999.

Transposée en droit français par le décret n° 2002-1508 du 23 décembre 2002, elle a pour objet de garantir que des informations relatives à la consommation de carburants et aux émissions de CO₂ des voitures particulières neuves, proposées à la vente ou en crédit-bail dans la Communauté, soient mises à la disposition des consommateurs, afin de permettre à ceux-ci d'opérer un choix éclairé.

Le décret du 23 décembre 2002 énonce :

- dans chaque point de vente, une étiquette indiquant la consommation de carburant et les émissions de dioxyde de carbone est apposée sur chaque voiture particulière neuve ou affichée près de celle-ci, d'une manière visible (article 2) ;
- une liste des données relatives à la consommation de carburant et aux émissions de dioxyde de carbone des voitures particulières neuves proposées à la vente ou en crédit-bail dans un point de vente, dressée par marque, par type de carburant et par émissions de CO₂ croissantes est affichée de manière visible dans le point de vente (article 3) ;
- l'Agence de l'Environnement et de la Maîtrise de l'Énergie élabore, à partir des informations transmises par les constructeurs, un guide de la consommation de carburant et des émissions de dioxyde de carbone des voitures particulières neuves mises en vente sur le territoire national, qui doit, dans chaque point de vente, être tenu à la disposition de tout consommateur qui demande à le consulter (article 4-I).

Le présent document constitue ce guide.

COMMENT LIRE LES TABLEAUX ?

Les tableaux contiennent certaines informations qui vous permettront de compléter l'appréciation des performances énergétiques et environnementales des véhicules neufs. Les véhicules essence et Diesel les plus performants (consommations cycles mixtes et émissions de CO₂ en ordre croissant pour les dix premières valeurs) sont présentés au chapitre « Palmarès ».

Pour l'ensemble des véhicules essence et Diesel présentés au chapitre suivant, les informations relatives à la consommation de carburant et aux émissions de dioxyde de carbone sont regroupées par marque, modèle, version (classés par ordre alphabétique) et par carburant (essence puis gazole).

Les listes des véhicules à carburant modulable (VCM), bicarburant essence/GPL, essence/GNV sont établies séparément selon le même principe.

NB : les données ont été fournies par l'UTAC en décembre 2009, après validation par les constructeurs. Elles seront disponibles sur le site www.ademe.fr et, ensuite, actualisées semestriellement.

MARQUES - Modèles, Versions	CNIT	Puiss.		BV	Consom.			CO ₂ g/km	Carburant	Classe CO ₂	Bonus (-) Malus (+)
		Admin. CV	Max. kW		Urb. Litres aux 100 km	Ex-urb.	Mixte				
		3	4	5	6	7	8	9	10	11	12

1 Identification

Désigne la marque, le modèle et la version ou l'appellation commerciale du véhicule concerné.

ABRÉVIATION	SIGNIFICATION
NP	nombre de portes
NPL	nombre de places
BVA	boîte de vitesse automatique
CLIM	climatisation
Xxx ch	puissance en chevaux

2 CNIT

Code National d'Identification du Type pour les véhicules couverts par une réception européenne.

3 Puissance administrative

La puissance administrative d'un véhicule est une valeur sans réalité physique exprimée en CV (pour chevaux fiscaux) qu'on retrouve sur la carte grise du véhicule sous la mention PUISS. Elle est en fait calculée à partir de deux caractéristiques du véhicule : son niveau de rejet kilométrique de CO₂ (en g/km) et sa puissance réelle (P en kW) selon la formule suivante :

$$Pa = \frac{CO_2}{45} + \left(\frac{P}{40}\right)^{1,6}$$

La valeur obtenue est alors arrondie à l'entier le plus proche et détermine la puissance administrative (ou fiscale) du véhicule. Depuis la disparition de la vignette pour les particuliers, elle a perdu de son intérêt, mais sert toutefois encore à établir le coût de la carte grise.

Elle sert également au calcul des nouvelles taxations, TVS et taxe additionnelle sur la carte grise, pour les véhicules n'ayant pas fait l'objet d'une réception communautaire.

4 Puissance réelle

La puissance réelle est une donnée importante, la consommation d'un véhicule étant étroitement liée à la puissance qu'il développe. Cette puissance réelle, mesurée sur l'arbre moteur, est exprimée en kilowatt (kW).

5 Transmission

M : boîte de vitesses mécanique.

La généralisation de la 5^e vitesse, sur la plupart des véhicules, est un facteur de réduction des consommations par abaissement des régimes moyens d'utilisation des moteurs.

A : boîte de vitesses automatique, convertisseur de couple ou variateur continu. L'émergence des boîtes de vitesses automatiques à 4 rapports ou plus tend à diminuer les écarts de consommation entre transmissions automatiques et manuelles.

3, 4, 5 ou 6 : nombre de rapports de transmission de la boîte (marche avant).

V0 : boîte de vitesses à variation continue.

6 7 8

Consommations - Cycles

Les consommations conventionnelles, mesurées sur cycles urbain, extra-urbain et mixte, sont exprimées en litres aux 100 km.

9 CO₂

Émissions de gaz carbonique sur le cycle mixte, exprimées en g/km.

10 Type de carburant

ES	essence sans plomb 95
GO	gazole
ES/GPL	bicarburant essence/GPL, données consommations essence
GP/ES	bicarburant essence/GPL, données consommations GPL
ES/GN	bicarburant essence/GNV, données consommations essence
GN/ES	bicarburant essence/GNV, données consommations GNV
GN	monocarburant GNV
FN	véhicule à carburant modulable (VCM)

NOTA : les émissions et consommations des véhicules à carburant modulable (VCM) sont mesurées uniquement en fonctionnement essence.

11 Classe CO₂

Émissions de CO₂ :

Classe A : inférieures ou égales à 100 g/km

Classe B : de 101 à 120 g/km

Classe C : de 121 à 140 g/km

Classe D : de 141 à 160 g/km

Classe E : de 161 à 200 g/km

Classe F : de 201 à 250 g/km

Classe G : supérieures à 250 g/km

12 Bonus écologique - Grenelle de l'Environnement

Figurent dans cette colonne, en bleu le montant en euros du bonus (-), ou en noir le montant en euros du malus (+), applicables lors de l'achat du modèle de voiture considéré.

Choisir : le choix d'un véhicule doit se faire prochainement, consultez alors les tableaux et comparez la consommation mixte des véhicules les plus performants avec la consommation mixte des véhicules que vous avez retenus. Les tableaux des coûts moyens kilométriques (pages 28 et 29) vous permettent d'apprécier les dépenses annuelles pour 15 000 kilomètres.

ADEME *en bref*

L'Agence de l'Environnement et de la Maîtrise de l'Énergie (ADEME) est un établissement public sous la tutelle conjointe du ministère de l'Énergie, de l'Écologie, du Développement durable et de la Mer et du ministère de l'Enseignement supérieur et de la Recherche. Elle participe à la mise en œuvre des politiques publiques dans les domaines de l'environnement, de l'énergie et du développement durable. Afin de leur permettre de progresser dans leur démarche environnementale, l'agence met à disposition des entreprises, des collectivités locales, des pouvoirs publics et du grand public ses capacités d'expertise et de conseil. Elle aide en outre au financement de projets, de la recherche à la mise en œuvre et ce, dans les domaines suivants : la gestion des déchets, la préservation des sols, l'efficacité énergétique et les énergies renouvelables, la qualité de l'air et la lutte contre le bruit.
